Advantages

① There is one global Minima

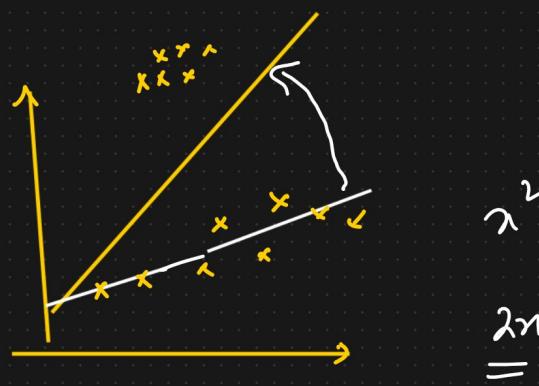

② It is differentiable

Disadvantage

① Not Robust to Outliers

{ MSE penalizes the Error }

$$\sum_{i=1}^n (y_i - \hat{y}_i)^2$$

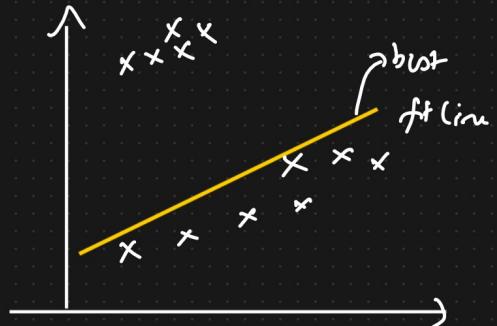

$$\frac{1}{2m} \sum_{i=1}^m \underbrace{\left(h_\theta(x^{(i)}) - y \right)^2}_{\text{Error}} \uparrow$$

(2) Mean Absolute Error

$$J(\theta_0, \theta_1) = \frac{1}{m} \sum_{i=1}^m |\hat{y} - y|$$

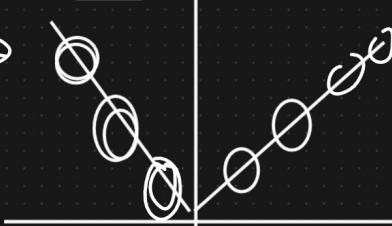

$$\hat{y} = h_\theta(x^i)$$
